**Frequency vs. Temperature Characteristics**

To calculate the frequency stability the parabolic curvature constant (K) is needed. For calculating the stability at 45°C?

1- Change in temperature ( $\Delta T$ ) is  $(45-25) = +20^\circ\text{C}$

2- Change in frequency is  $(-0.034 \times (\Delta^\circ\text{C})^2) = (-0.035 \times (20)^2) = -13.6\text{ppm}$
